The fourth edition of this well-known and highly regarded book by Tile et al is now a two-volume comprehensive set of books based on the AO principles of operative management of fractures, as applied to the pelvis and acetabulum. With the collaboration of over 80 international expert surgeons and through hundreds of images and illustrations, the books emphasize decision making based on the assessment of the personality of the injury through the patient’s history, physical examination, and interpretation of radiographic investigations.

The acute management of pelvic and acetabular fracture patients, the definitive treatment of both fractures by operative approaches for reduction and internal fixation (from conventional methods to new percutaneous techniques), and extensive analysis of the outcomes of pelvic and acetabular fractures are covered in detail. This two-volume set also offers in-depth video presentations of surgical approaches and reduction techniques performed by world-renowned experts.
